

Health Care Facility Indoor Air Quality

Construction within patient areas of health care facilities can represent a serious risk to post-operative or immuno-compromised patients.

In order to mitigate the risk, health care professionals often turn to consultants who are experienced in both construction management techniques as well as indoor air quality.

With our team of experienced engineers, scientists, technicians and technologists, Concentric has provided these services to health care facilities for over three years.

A typical assignment would include the use of highly sensitive direct reading instruments which can detect, in real time, individual parameters that can affect the quality of indoor air.

Real time detection of indicator parameters results in quick implementation of mitigative measures.
